

Model Updates

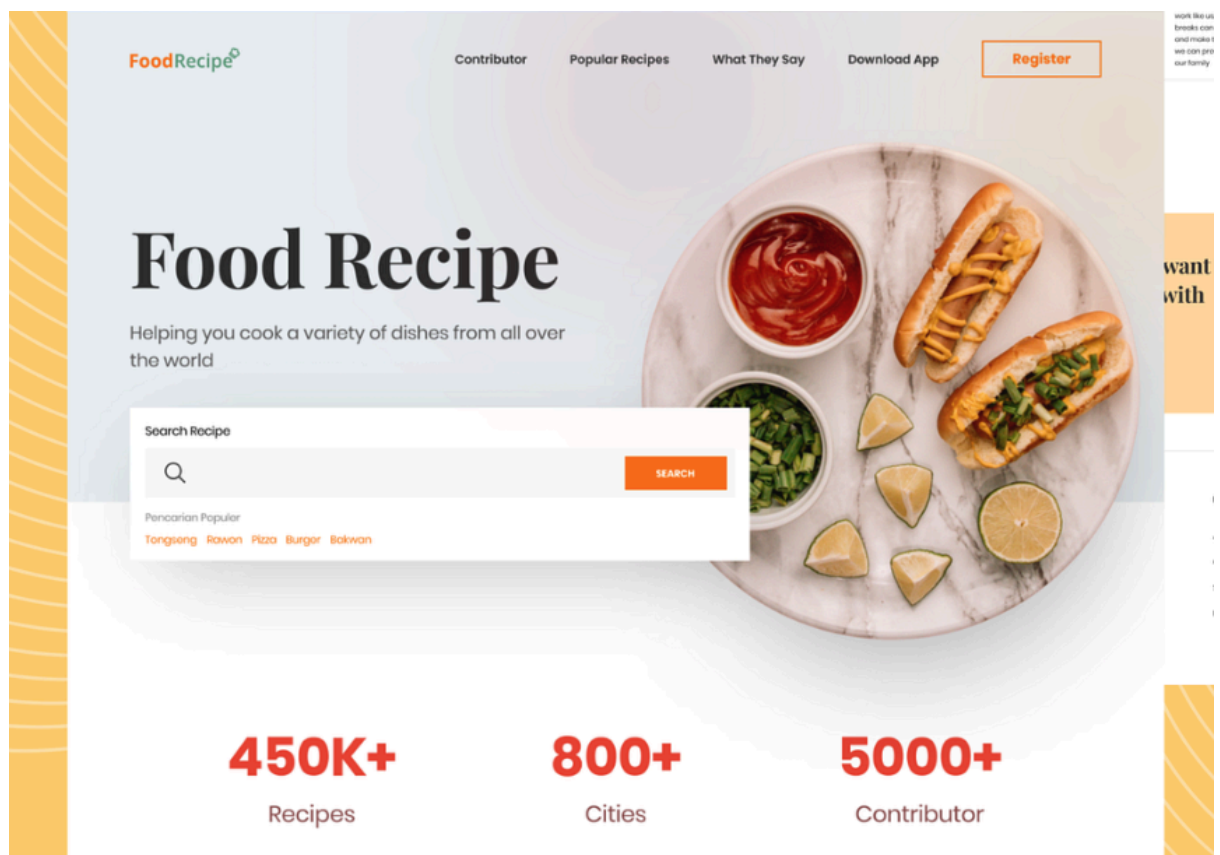

Compared to my original database blueprint (models outline), I newly added the “pic” attribute to the recipes and users tables to support visual representation of recipes and users, and the “directions” attribute to the recipes table to be able to add a complete procedure for how to make a recipe.

Frontend Inspirations

I honestly didn't find any existing application that I'd particularly like to be inspired from, I did a Google search for “recipe app welcome page” and it did bring up some interesting designs which inspired me. For example:

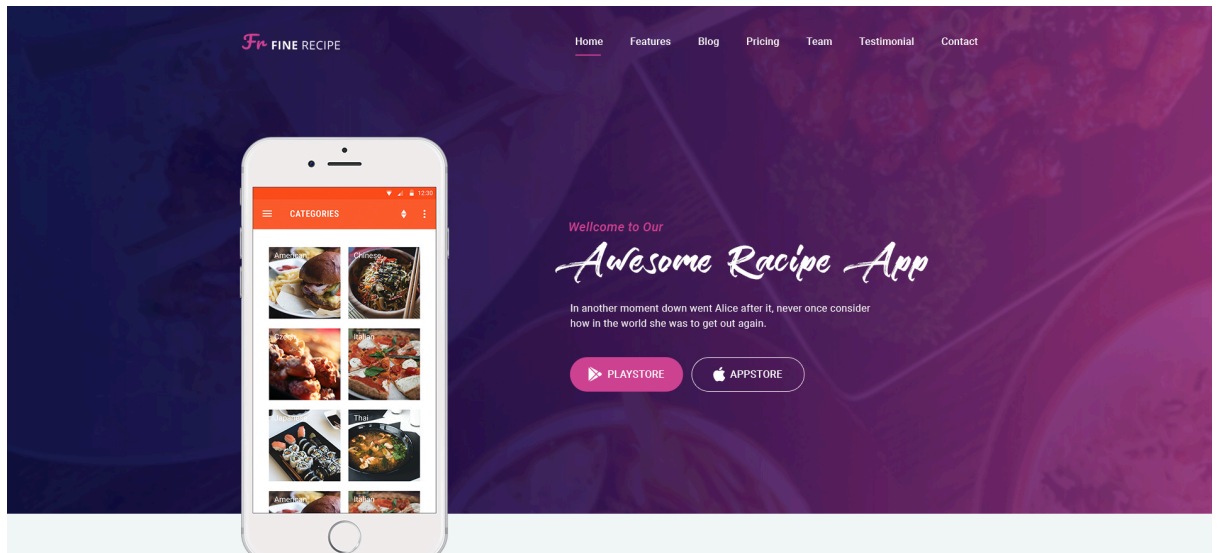

1. <https://dribbble.com/shots/16172317-Food-Recipe-Landing-Page>

I like the simple design, subtle colors here and the simple graphic that doesn't distract but highlights the main purpose of the app.

2. <https://themeforest.net/item/fine-recipe-app-landing-page/19827287>

Again, very simple welcome page, I like the color scheme and the placement of text and buttons. For my app, this kind of welcome page will also allow me to add more navigation content later, such as new buttons, easily. Given that the background is neat, just an image with a gradient overlay which I like.

3. <https://yellowimages.com/stock/flavoriz-food-recipes-landing-page-126894>

Here, I like how different recipe cards are designed where the picture is the center of attention and recipe title a potentially tags are placed over. It looks like clean, visually appealing layout. The landing page is also very clean, attractive, and simple.
